Abstract

The fieldwork in 2003 was carried out in the Ham Tan area in southern Vietnam. Altogether 35 samples of raw sand samples were collected. The heavy mineral content in the sands varies a lot within the areas. Most of the heavy mineral occurrences occur in aeolian sand dunes. The most promising area for heavy mineral resources looks like to be the area between Chum Gang and Tan Thang. These areas have the largest potential in tonnage and are not planned for other purposes such as industrialisation or urbanisation.

A special assignment was to collect samples of the ilmenite concentrate from the Ky Khang deposit, Ha Tinh province. The stockpile was a 15,000 tonne ilmenite heap where 10 samples were taken. XRF results of the ilmenite from the stockpile are given in this document. In addition, a CCSEM analysis is given of the raw sand, which is the basis for the ilmenite concentrate. This CCSEM analysis of the raw sample from Cam Xuyen has high-grade of TiO_2 with more than 60% (see figure below).

During the meetings with different organisations in Vietnam it turned out that there is still areas with high-grade ilmenite in Vietnam e.g. the Hué region. The Marine and Mineral Resources Centre gave us this information about the new high-grade ilmenite placer deposits. The Centre will try to help to get this information verified. This Hué region has not been visited in our joint program but will be the next target for investigations.

Figure 1. *The field sampling party – from left the driver Mr. Tinh, Deputy Director Mr. Hop, and Senior Geologist Mr. Thien.*

Introduction

The joint venture heavy mineral sampling programme between the Department of Geology and Minerals of Vietnam (DGMV), the Geological Survey of Denmark and Greenland (GEUS) and DuPont continued the work from 2002 (Stendal 2003) in 2003. The latter sampling tour (Fig. 1) and the results of the black sands is reported below.

The fieldwork was carried out in the period from May 5 to May 22nd including travel time. The main focus of the field-sampling programme was the Ham Tan area, which covers parts of the provinces Binh Thuan and Vung Tau – Ba Ria in southern Vietnam (Figs. 2 and 3). A special assignment was to collect samples of the ilmenite concentrate from the Ky Khang deposit, Ha Tinh province. The shipment for Dupont is a 15,000 tonnes ilmenite stockpile at the port of Vung Ang. The travelling distance altogether during fieldwork was 4,365 km.

Itinerary schedule

May 5 – departure Denmark
May 6 – arrival Hanoi, Vietnam via a transit in Bangkok. Planning of next day
May 7 – meetings at DGMV and planning of fieldtrip. Meeting with Sumitomo Corporation
May 8 – fieldtrip starts – travel to Hué – 650 km
May 9 – travel to Nha Trang – 600 km
May 10 – travel to Phan Thiet and meeting at the local Industrial Department Office – 250 km
May 11 – fieldwork in the Ham Tan area – 120 km
May 12 – fieldwork in the Ham Tan area – 202 km
May 13 – fieldwork in the Mui Né area and travel to Vung Tau. Meeting at the local Industrial Department office – 236 km
May 14 – fieldwork in the Long Hai and Vung Tau areas and travel to Ho Chi Minh City (Saigon) – 260 km
May 15 – travel Ho Chi Minh City - Dalat – 345 km
May 16 – travel Dalat – Quy Nhon – 405 km
May 17 – travel Quy Nhon – Dong Ha – 539 km
May 18 – travel Dong Ha – Thien Cam and meeting with Mitraco Hatinh – 318 km
May 19 – together with people from Mitraco Hatinh for collecting ilmenite concentrates samples at the warehouse of Vung Ang Port and at the Cam Xuyen Separation Plant. Travel to Hanoi – 510 km
May 20 – meetings at DGMV and budget accounting
May 21 – meeting at the Marine Geology and Mineral Resources Centre and departure from Hanoi to Bangkok
May 22 – Bangkok to Denmark

Figure 2. Main sampling area in Bin Thuan 2003 in southern Vietnam

Administrative business

On May 6 I was picked up by Vice Director of 'International Cooperation Division' Mr. Hop and Ms. Bui Thi Huyen, interpreter from the 'International Cooperation Division' in the Hanoi International Airport. They took me to the ATS Hotel, which is placed only 5 minutes walk from the Department of Geology and Minerals of Vietnam (DGMV). At the hotel the programme for the next day and the coming field trip was briefly discussed. We also handled the formalities and budget for the fieldwork.

DGMV

A formal morning meeting at DGMV concerned a presentation of the heavy mineral project in Vietnam by HSt. The project is carried out as a joint project between DGMV, GEUS and Dupont (Stendal 2003). The formal meeting had representatives from the board of directors and interested geologists from DGMV. Twelve people attended the meeting and among those were:

- Deputy Director General, DGMV, Dr. Nguyen Thanh Van,
- Director for Administration, DGMV, Mr. Nguyen Van Quyen,
- Director, Marine Geology and Mineral Resources Centre (MGMC), Dr. Dao Manh Tien,
- Deputy Director of Geological Section, DGMV, Dr. Nguyen Van Quy,
- Vice Director of International Cooperation Division, DGMV, Mr. Hop
- Ms. Bui Thi Huyen of International Cooperation Division, DGMV, interpreter and she also acted as interpreter at the meeting.

After the formal meeting the coming fieldwork were planned with the Director Ms. Nguyen Thi Dzung, the Vice Director Mr. Hop and the interpreter Ms. Bui Thi Huyen.

After the fieldwork another meeting was held at DGMV concerning accounting and reporting on the fieldwork for the administration at DGMV.

Sumitomo Corporation / Mitraco Co.

The same day I left Denmark I was requested from Dupont to take samples from the ilmenite that is being stockpiled for Dupont's upcoming shipment in early July. There is about 15,000 tonnes already produced and stockpiled. I got e-mail from Norman B. Shurak, Dupont with a contact address in Hanoi. After a phone contact to manager Ms. Pham Thi An Ninh, Sumitomo Corporation we arranged a meeting at the company's residence in Hanoi at 2 p.m. The Sumitomo Corporation is distributor for Mitraco Co. We (HSt, Ms. Huyen and Mr. Hop) had the meeting together with the manager Ms. Pham Thi An Ninh and assistant manager Ms. Nguyen Thuy Ha. The director himself was in Ha Tinh. The managers thought it was OK to take the samples but we got the agreement that we should phone before leaving the Ham Tan area and pick up the samples on May 18 or 19 on our way

back to Hanoi. The stockpile is placed in a warehouse at Vung Ang Port. The purpose with the samples (10 samples) was to check if the piles of ilmenite are homogeneous concerning the TiO_2 content, impurities and grain size.

On May 18 we met the Director General of Mitraco Co. Mr. Vo Kim Cu and again on May 19 after we had sampled our ilmenite samples from the stockpile in Vung Ang Port and at the separation plant in Cam Xuyen. Director General Vo Kim Cu is head of Viet Nam Titanium Association and Hatinh Minerals and Trading Corporation (Mitraco Hatinh). At the sampling sites the Technical Manager Mr. Bui Van Bang accompanied us.

Local Industrial Departments

The Binh Thuan Industrial Department in Phan Thiet was visited and the Chief of Mineral Resources Management Service, Mr. Nguyen Van Tam told us about the heavy minerals in the region. The total heavy mineral ore in the area comprise 100 km² and the tonnage is estimated to be between 5-10 mill. Three deposits have 700,000 tonnes of ilmenite. The office provided us with maps showing the location of the heavy mineral deposits. In addition, Mr. Do Xuan Lam accompanied us during the fieldwork.

In Vung Tau the Deputy Director Mr. Ha from the Mineral Division of Industrial Department of Ba Ria – Vung Tau Province received us. During the fieldwork in that region Mr. Pham Huynh Khang guided us.

Marine and Mineral Resources Centre

The future name for this Centre will be Marine Geological Division. The visit to the Centre was an acceptance of an invitation from the Director Dr. Dao Manh Tien, who thought that we had some common interests. Deputy Director Mr. Vu Truong Son welcomed us. He introduced us to the Centre and their activities. The main activity for the Centre within the last few years has been the completion of the investigation and reporting of the 'Geology and mineral resources of the shallow offshore area of Vietnam at 1:5000,000 scale (0-30 m water depth)'. The maps were still in progress but some maps were completed. The maps exist both as hard copy and as digital maps made in Arc/MapInfo. Among the result Quaternary and superficial sediments have been subdivided. The thickness of the Quaternary sediments, the extent of fault systems has been determined based on shallow seismic data. Mineral resources such as placers of ilmenite, zircon and common sands are located. The prospective zoning of these minerals is still preliminary, corresponding to small-scale survey level. The shallow-water depth studies also give information on environment matters, stability of the shoreline and evaluation of the impact of economic activities on the environment. In local areas isobathic maps with interval of one-two m and topographic features in the shallow offshore area are produced, which are of high utility for various economic and basic survey sectors.

The Centre had also information about new high-grade ilmenite placer deposits in the Hué area. The Centre will try to help to get this information verified. The Centre does joint projects with companies and the Provinces of Vietnam.

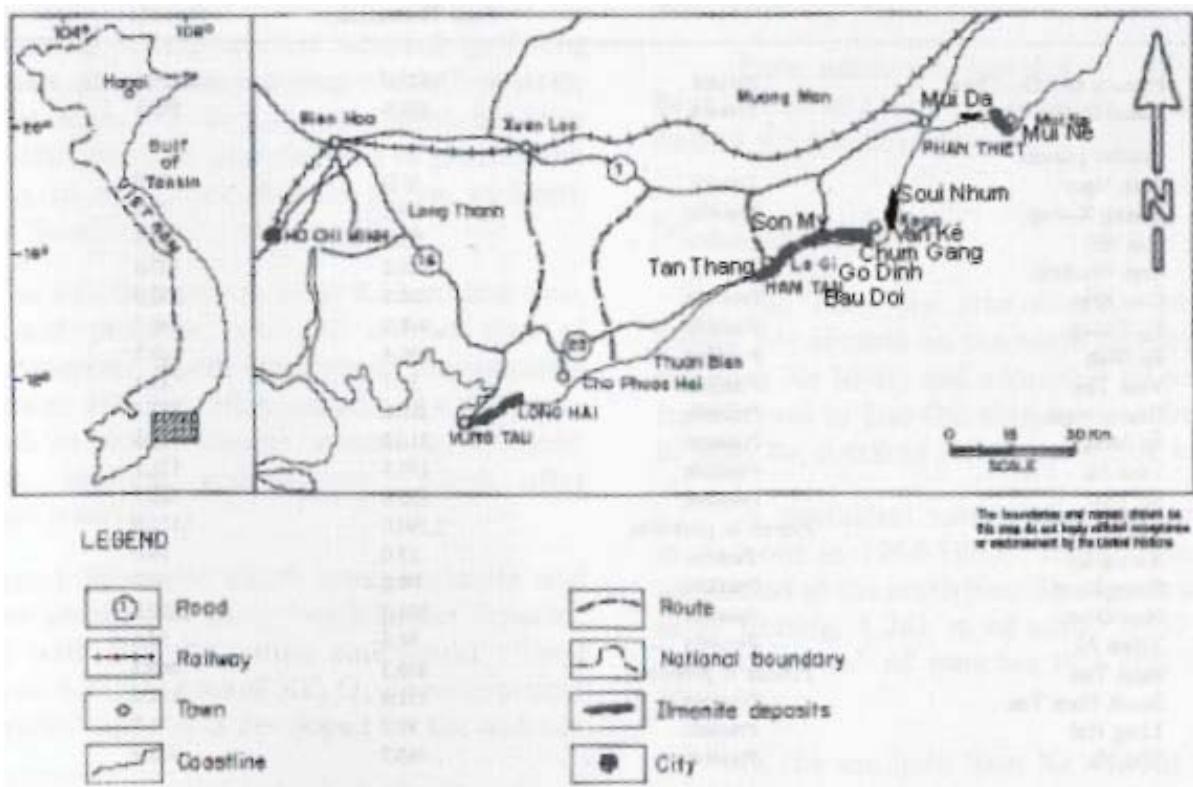

Figure 3. *Bin Thuan region and the sampling localities from Mui Né in East to Vung Tau in West.*

Physiographic conditions

Access to the sampling sites is in most cases easy but on some sites walking up to a few kilometres is necessary. Highway No. 1 pass the region and all bigger roads have asphalt and smaller roads are stone paved. Railway connection occurs close to Phan Thiet. Port facilities are present in Vung Tau. The climate is hot and humid all the year around with many sun days and the rainy season from May to November. The average temperature all year is around 27°C and the precipitation varies from 1200 to 2000 mm/year.

Figure 4. *Typical sand dunes in the Soui Nhum area.*

Geology of the Ham Tan area

The coastal accumulative plain has a width of 10 to over 20 km, formed by Holocene marine or fluvio-marine sediments. The seashore is in many places characterised by opened gulfs separated by small mountains. The strip of caostal terraces formed by fluvio-marine deposits is 10-50 m in heights. Behind these terraces red sand raising up to some hundreds metres. Along the coast zone discontinuous bands of sand dunes occur ranging 5-20 m in height in comparison with the adjacent relief. The sand is well-sorted and well-rounded, yellowish-grey coloured. The grain size is fine to medium-grained sand with the main composition of quartz (95-98%) with varying amounts of heavy minerals. Between the fluvio-marine sediments and the sand dunes marine-marshy lowland occur. This is an area of salt-marshy forest lying in the estuarine and coastal zones (mangrove zone). The hinterland behind the coastal zone consists of Lower-Middle Jurassic sediments and Upper Jurassic-Cretaceous volcanogenic formations, covered by Cenozoic basalts and sedimentary formations.

The tectonic evolution in the Pliocene-Quaternary period is stable except for magmatic hot spots. During Middle and Late Pleistocene the alkaline basalt effusion appeared in an arched uplift. In the piedmont plains and valleys, and the coastal zone the depositional accumulation took place with unconsolidated sediments of marine-aeolian facies. In the hilly zones the processes of weathering, erosion and abrasion occurred.

The ilmenite resources within the Phan Thiet geological map (Thang 1999b) the ilmenite occurrences are described as marine placer deposits. The ore body stretches from 1,500 to 15,700 m, with a width of 150 – 1,800 m, and a thickness of 1 – 3.5 m, in places up to 10 m. The reserves of ilmenite is approximately 500,000 tonnes of ilmenite and 80,000 tonnes of zircon. In the southern Ham Tan area and Long Hai the ilmenite occurrences is described as littoral placer type. The reserves in these latter areas are nearly 200,000 tonnes of ilmenite and 33,000 tonnes of zircon. The fieldwork revealed that the ilmenite occurrences all are interpreted as aeolian dune deposits (Fig. 4).

For further reading of the geology to the area the descriptions to the 1:200.000 scale geology and mineral resources map of Vietnam is recommended. The descriptions are published in 1999 and cover the Pan Thiet sheet (C-49-VII) Gia Ray – Ba Ria sheet (C-48-XII & C-48-XVIII) – see Thang 1999a & 1999b.

Sampling procedure

A hand-auger (Fig. 5) was used for sampling in the beginning but it was not a great success of different reasons. Firstly, it was very hard to drill into the dunes and secondly in most cases the sample material did not stay in the tube. The hand-auger was 2 m in length and had a 30-cm long tube, which was 5 cm in diameter. Most of the samples are taken as one to two m profiles after digging into the dune or where steep section of the dune showed cross bedding. The sample is scraped along the wall in the hole/section with a small stainless shovel. The size of the sample is between 500-1000 g. All samples are representative for the site as described in the sample description. The latitude and longitude coordinates are given in decimal degrees (Table 1).

Figure 5. *The auger in use on a sand dune, Soui Nhum deposit.*

In the Ham Tan region 35 HM samples were collected during the field campaign. For the special assignment concerning Ky Khang deposit and its stockpile (10 samples) and new sample from the Camson deposit. The HM sands from Camson are mixed with the Ky

Khang sands in the processing plant and one sample of the ilmenite concentrate were taken.

In the laboratory the raw sand samples are poured into heavy liquid to get the heavy minerals (HM) separated. A split of the HM separate is taken for the CCSEM analysis.

Fieldwork

The travelling team met at ATS Hotel 6.15 a.m. (May 8) in a blue four-wheel drive Toyota Landcruiser. The team comprises the Vice Director Mr. Hop, Senior Geologist and interpreter Mr. Thien, and the same driver as last year Mr. Tinh. We departed at 6.45 a.m. heading south out of Hanoi. We had a short stop in Vinh City and picked-up the hand augers to be used during the fieldwork. We passed Ha Tinh and 50 km south of Ha Tinh the stockpiles of ilmenite for shipping to USA is placed at Vung Ang Port in a warehouse. We passed the Demilitarised Zone (DMZ) at 17°N and ended up in Hue City at Le Loi Hotel six o'clock p.m. On May 9 we drove the whole day and reached Nha Trang eight o'clock in the evening altogether 600 km. We stayed overnight in guestrooms at the 'Central Vietnam Division of Hydrology and Engineering Geology' where the Director Mr. Vu Ngoc Tram gave us great hospitality. We left Nha trang on May 10 heading for Phan Thiet where we arrived at 12.30 p.m. We had a meeting at the office of the Binh Thuan Industrial Department. The Chief of Mineral Resources Management Service Mr. Nguyen Van Tam introduced us to the Ham Tan region. The area contains 5-10 Mt of heavy minerals over 100 km². The area has until now delivered 700.000 tonnes of 90% ilmenite. The wish for the region was to have a pigment factory, but as a joint venture with foreign investment. We were supplied with copies of maps showing the HM deposits in the area. People of this local office had produced the maps.

In the second field area in the Vung Tau region Mr. Khang from the Mineral Division of the Industrial Department in Vung Tau were our guide in the Long Hai and Vung Tau mineral occurrence areas.

Field areas

Ham Tan region

The distribution of ilmenite deposits in the Ham Tan region and the location in Vietnam is shown in the Figures 1 and 2 (Fig. 2 modified after Loan 1990). The Ham Tan region comprises the following deposits from East to West: Soui Nhum, Van Ké, Chum Gang, Go Dinh, Bau Doi, Son My, and Tan Thang.

Soui Nhum

The aeolian dunes are maximum 10 m high, one kilometre in length and 50-200 m wide. The hand auger has a sampling tube 30-cm in length, which correspond to the sample vol-

ume c. half a litre. The two samples collected had 1-2% heavy minerals in the sand (Table 1).

| GPS | LATITUDE | LONGITUDE | Sample # | GEUS # | Type |
|-----|------------|-------------|----------|---------|----------------|
| 1 | 10,7732642 | 108,0178463 | VN 01 | 2000369 | Raw sand, dune |
| 2 | 10,7732642 | 108,0174976 | VN 02 | 2000370 | Raw sand, dune |

- VN 01 Top of dune, hand auger, and the sample from 2-m depth, 1.0% HM contents.
VN 02 Top of dune, hand auger, and the sample from 2-m depth, 1.7% HM contents.

Van Ké

Aeolian dunes strokes along the coast, less than 10 m high and a few hundreds m wide. The dunes might be deposited on beach sand according to the guides.

| GPS | LATITUDE | LONGITUDE | Sample # | GEUS # | Type |
|-----|------------|-------------|----------|---------|----------------|
| 3 | 10,7239545 | 108,0023431 | VN 03 | 2000371 | Raw sand, dune |
| 4 | 10,7243890 | 108,0036789 | VN 04 | 2000372 | Raw sand, dune |

- VN 03 Middle of dune, hand auger, and the sample is taken in 2-m depth - 0,53% HM.
VN 04 Beach sand (?), base of dune, hand auger, and the sample from 2-m depth - 0,67% HM (Table 1).

Chum Gang

Some parts of this area are already exploited but unexplored large areas still occur. The aeolian dunes are only 1 to 3-m in height and 50 to 100 m in width. The HM content is clearly visible and disseminated. This deposit was also visited last year and the samples V 23 (2000203) and V 24 (2000204) are taken in the same area. The TiO₂ content in ilmenite in these samples was 55%.

| GPS | LATITUDE | LONGITUDE | Sample # | GEUS # | Type |
|-----|------------|-------------|----------|---------|-----------------|
| 5 | 10,7057798 | 107,9636979 | VN 05 | 2000373 | Raw sand, dune |

| 8 | 10,7075179 | 107,9571157 | VN 08 | 2000376 | Raw sand, beach |

- VN 05 Top of aeolian dune, the sample represents one metre profile - 4.4% HM.
VN 06 Middle part of aeolian dune, where the sample represents one metre profile - 6.74% HM.
VN 07 Lower part of aeolian dune, the sample taken with hand auger in 2-m depth - 5.52% HM (Table 1).
VN 08 Beach sample – upper tide zone, the sample represents 0.5-m profile. Relatively high HM content in mm-cm thick bands - 39.16% (Table 1).

Bau Doi A and B

Shallow sand dunes with 2-3 m thick layer rich in heavy minerals in the Bau Doi A deposit (VN 09 - VN 11). The upper 1-2 m of the dune is low in HM content but the lower 2-3 m of the dune is rich in HM. The heavy minerals are sitting in mm-cm thick bands in the cross-bedded dune. In the Bau Doi B deposit (VN 12 - VN 13) the dunes are 20-25 m in height and has the same textures as in Bau Doi B (Figs. 6 and 7).

Figure 6. Cross-bedded dune with mm-cm thick bands from Bau Doi B.

| GPS | LATITUDE | LONGITUDE | Sample # | GEUS # | Type |

| 13 | 10,6893057 | 107,8055012 | VN 13 | 2000381 | Raw sand, dune |

- VN 09 Middle part of aeolian dune, the sample represents depth of 1 - 1.55 m - 8,49% HM.
VN 10 Lower part of aeolian dune, the sample represents two-metre profile - 7,66% HM.
VN 11 Upper part of aeolian dune, where the sample represents one metre profile - 2,57% HM.

- VN 12 Upper part of aeolian dune, the sample represents one metre profile 5-m below top of dune - 7.32% HM.
- VN 13 Lower part of aeolian dune, the sample represents two-metre profile - 4,43% HM (Table 1).

Figure 7. *Laminae of heavy minerals in sand dune, Bau Doi A.*

Tan Thang

Three different rows of sand dunes all have varying amounts of heavy minerals. Between the sand dunes basins occur with shrimp farming. The dunes are 10-30 m in width and up to several hundreds of m long. The dune longest away from the coast is up to 50 m in width.

| GPS | LATITUDE | LONGITUDE | Sample # | GEUS # | Type |
|-----|------------|-------------|----------|---------|----------------|
| 14 | 10,5809659 | 107,5902485 | VN 14 | 2000382 | Raw sand, dune |

| 16 | 10,6190479 | 107,6609140 | VN 16 | 2000384 | Raw sand, dune |

- VN 14 Upper part of a maximum 5-m high aeolian dune, where the sample represents one metre profile - 5,21% HM.
- VN 15 Upper part of aeolian dune, the sample represents one metre profile. The HM occurs in mm bands averaging 1,86% HM.
- VN 16 Upper part of aeolian dune, where the sample represents one metre profile - 0,63% HM (Table 1).

Son My

At Son My perpendicular to the coastline two profiles were sampled. Two rows of sand dunes occur striking along the coast separated by a lagoon. The dune closest to the sea is 100 wide and up to 10-m in height. The dune away from the coastline is 50 m wide and lower than the sea dune.

| GPS | LATITUDE | LONGITUDE | Sample # | GEUS # | Type |
|-----|------------|-------------|----------|---------|-----------------|
| 17 | 10,6107170 | 107,6609140 | VN 17 | 2000385 | Raw sand, dune |
| 18 | 10,6093437 | 107,6615309 | VN 18 | 2000386 | Raw sand, dune |
| 19 | 10,6188923 | 107,6565313 | VN 19 | 2000387 | Raw sand, dune |
| 20 | 10,6328827 | 107,7248150 | VN 20 | 2000388 | Raw sand, dune |
| 21 | 10,6313968 | 107,7230286 | VN 21 | 2000389 | Raw sand, beach |

- VN 17 Upper part of the coast aeolian dune, where the sample represents one metre profile - 4,71% HM.
- VN 18 Base of the aeolian coast dune, the sample represents 0.5-m profile - 4% HM in mm lamellas.
- VN 19 Middle part of aeolian dune away from the coast, the sample represents 1.5-m profile - 3,35% HM in up to one centimetre thick layers.
- VN 20 Three metres below top of aeolian dune, the sample represents 2-m profile. 12,94% HM occurs in cm-thick layers of black sands.
- VN 21 Beach sand from the upper tide zone, the sample represents 30-cm profile of mm-laminated black sand layers - 27,79% HM (Table 1).

Go Dinh 1 and 2

Some parts of the Go Dinh 1 area has been exploited for heavy minerals but a coast parallel dune and a dune 0,5-2 km from the coast are not exploited. The coast parallel dune is only 2-3 m high, 5-10 m wide and up to 3 km long (sample VN 22). The inland dune is 5-6 m high, 20-30 m wide and several km long along strike (VN 23). Go Dinh 2 consists of an overgrown dune, which varies 5-10 m in height and 50-100 m in width (VN 24).

- VN 25 Top of aeolian dune, where the sample represents one metre profile - 0,58% HM.
- VN 26 Middle part of aeolian dune and the sample represent 0.5-m profile - 0,35% HM (Table 1).

Mui Né

The Mui Né area develops both industrial and holiday resorts. The dunes in the area are not well defined but cover large areas in the backyard of the town. The dune area is elevated 5-10 m over the town area. The general content of HM is low.

- VN 27 Lower part of aeolian dune, where the sample represents one metre profile - 4,86% HM.
- VN 28 Top of aeolian dune, the sample represents 1.5-m profile with 6,05% HM.
- VN 29 Top of partly overgrown aeolian dune, the sample represents one metre profile - 1,69% HM (Table 1).

Long Hai

Mr. Khang from the Mineral Division of the Industrial Department in Vung Tau were our guide in the Long Hai and Vung Tau areas. The potential Long Hai aeolian sand dunes with heavy mineral covers 4 km in length and 200-300 m in width and the height is 2-4 m (Fig. 8). We were given the following figures concerning the HM contents in Long Hai. The potential resources are 72,000 tonnes of ilmenite and 10,500 tonnes of zircon with grades of: Ilmenite 156 kg/m³, zircon 21.9 kg/m³ and rutile 21.9 kg/m³.

Figure 8. Sand dune along the coastline in Long Hai.

The dunes are located very close to the town and within the outbuilding of industrial areas. Some parts of the dune are exploited for sand for construction. The samples represent a profile starting from the coast (VN 30) and going inland.

| GPS | LATITUDE | LONGITUDE | Sample # | GEUS # | Type |
|-----|------------|-------------|----------|---------|----------------|
| 30 | 10,4039348 | 107,1914952 | VN 30 | 2000398 | Raw sand, dune |
| 31 | 10,4051364 | 107,1918386 | VN 31 | 2000399 | Raw sand, dune |
| 32 | 10,4050666 | 107,1935874 | VN 32 | 2000400 | Raw sand, dune |
| 33 | 10,4061020 | 107,1951538 | VN 33 | 2000651 | Raw sand, dune |

- VN 30 Upper part of the aeolian dune and the sample represents 1.5-m profile - 1,10% HM.
- VN 31 Top of partly overgrows aeolian dune, where the sample represents one metre profile - 1,36% HM.
- VN 32 Middle part of aeolian dune but top of dune, the sample represents 2-m profile with 3,14% HM in mm-thick lamellas.
- VN 33 This dune is longest away from the coast. Top of partly overgrown aeolian dune and the sample represents 2-m profile. The profile starts from 1.5-m below the top - 4.59% HM (Table 1).

Vung Tau

The potential of the Vung Tau aeolian sand dunes with heavy mineral covers 8 km in length and 200-300 m in width and the thickness of the heavy mineral bearing layers are 1-3 m. The sand dunes occur in up to three parallel rows. We were given the following figures concerning the HM contents in Vung Tau. The potential resources are lesser than in the Long Hai area with 28,000 tonnes of ilmenite with grades of:

| | |
|-----------|----------------------------|
| Ilmenite | 30-40 kg/m ³ |
| Zircon | 1.4-50.6 kg/m ³ |
| Rutile | 0.2-9.4 kg/m ³ |
| Leucoxene | 1.4-9.4 kg/m ³ |

The dunes are located very close to especially industrial areas. Some parts of the dune are exploited for sand for construction.

| GPS | LATITUDE | LONGITUDE | Sample # | GEUS # | Type |
|-----|------------|-------------|----------|---------|----------------|
| 34 | 10,3950298 | 107,1438324 | VN 34 | 2000652 | Raw sand, dune |
| 35 | 10,3950191 | 107,1271812 | VN 35 | 2000653 | Raw sand, dune |

- VN 34 Base of 10-15 m high dune, 100 m wide, where the sample represents one metre profile - 0,76% HM.
VN 35 Top of overgrown 5-m high aeolian dune, the sample represents 1.5-m profile - 0,50% HM (Table 1).

Analytical results

Table 1. Main result of the CCSEM analyses. See the detailed analyses in Appendix 1.

| Lab. # | Field # | % - HM of total | TiO ₂ % Rutile | TiO ₂ % Rutile | % Ilme- nite of total | % Rutile HM | % Leuco- xene of total | % Ti- mag- netite of total | % Zir- con of total | % Gar- net of total |

Nearly all the collected samples are taken from aeolian sand dunes, which are striking parallel to the coastline. The total heavy mineral content varies a lot in the raw sand sample but generally the content in the aeolian sand dunes is low with few exceptions (Table 1). In table 1 the heavy mineral contents of ilmenite, rutile, leucoxene, Ti-magnetite, zircon and garnet is also shown together with the average TiO_2 content of all TiO_2 minerals exclusive and inclusive rutile. No other minerals than the mentioned are found interesting in the CCSEM results (Appendix 1).

The sampling area in the southern Vietnam (VN01-VN35) is characterised by uniform distribution of the heavy minerals containing 50-60% ilmenite with a TiO_2 content from 54-57% and 1-3% higher when rutile is included in the calculation (Table 1). Only one sample (VN34) has over 60% TiO_2 . This deposit in Vung Tau is rather small and does not have a tonnage potential. The most promising area for heavy mineral resources looks like to be the area between Chum Gang and Tan Thang (Fig. 2). These areas have the largest potential in tonnage and are not planned for other purposes such as industrialisation or urbanisation. The highest TiO_2 content in ilmenite in this area is around 59%, which is found in Chum Gang (VN 05), Bau Doi A (VN11) and Go Dinh 2 (VN24). TiO_2 content around 58% is proven in Van Ké (VN03), Tan Thang (VN14), Son My (VN19) and Go Dinh 1 (VN22). The Mui Da, Mui Né, Vung Tau and Long Hai regions are all in a developing stage such as urbanisation, industrialisation and as tourist resorts.

The most valuable mineral after the ilmenite in the HM samples is zircon, which has considerable amounts from 6-15% of the total HM content. The leucoxene amounts from 3 to 8% except for one sample with 13% (VN34).

Special assignment results

As mentioned in the introduction a special assignment was to collect samples of the ilmenite concentrate from the Ky Khang deposit, Ha Tinh province, which is purchased by Dupont. The shipment for Dupont is a 15,000 tonnes ilmenite stockpile at Vung Ang Port. The stockpile is placed in a warehouse (Fig. 9). The purpose with the samples (10 samples) was to check if the piles of ilmenite are homogeneous concerning the TiO_2 content, impurities and grain size. At Cam Xuyen separation Plant an ilmenite concentrate was collected at the outlet of the ilmenite tube as well (VN 46). In addition, the raw sand from where the ilmenite is separated to Dupont is a mixed sample consisting of sands from two deposits - Ky Khang and Camson (VN 47; Fig. 10). The sample is collected from a stockpile at the separation plant in Cam Xuyen. We do not have a sample from the Camson deposit alone, but have samples from Ky Khang from last year's program.

The CCSEM result of the sample from the Camson deposit (VN 47) is given in Tables 1 and 2 and a typical CCSEM image of a heavy mineral sample is shown in Figure 11. The CCSEM data show have high grade of TiO_2 with more than 60% (Fig. 12) and a grain size distribution from 100-200 μm (Figure 13).

Stockpile ilmenite

One of the tasks of the study was to determine the grain size of the ilmenite in the stockpile. The sieving results of the stockpile ilmenite (VN 36 – VN 45) and the ilmenite (VN 46) from the separation plant is shown in Table 3. Two sets of sieving intervals were done noted as 1 and 2 in Table 3.

Table 3. Sieving results of the ilmenite concentrates from the stockpile (VN36-45) and one sample from the separation plant (VN46).

| Sample # | VN 36-VN 45 mm | VN 36-VN 45 g | VN 36-VN 45 wt.% | VN 46 Cumulative % | VN 46 g | VN 46 wt.% | VN 46 Cumulative % |

| 2 | | | | | | | |
| | >0,250 | 0,49 | 1,01 | 1,01 | 1,19 | 2,03 | 2,03 |
| | 0,150 | 10,45 | 21,44 | 22,45 | 8,21 | 14,02 | 16,05 |
| | 0,106 | 19,37 | 39,73 | 62,18 | 25,32 | 43,25 | 59,30 |
| | 0,075 | 16,94 | 34,75 | 96,93 | 21,92 | 37,44 | 96,74 |
| | 0,063 | 1,23 | 2,52 | 99,45 | 1,55 | 2,65 | 99,39 |
| | 0,045 | 0,20 | 0,41 | 99,86 | 0,30 | 0,51 | 99,90 |
| | <0,045 | 0,07 | 0,14 | 100,00 | 0,05 | 0,09 | 99,99 |

Around 20% of the ilmenite have a grains size lower than 100 µm (<0.1 mm). In the sieving interval from 0.075-0.106 mm 34.75% of the ilmenite fall into this interval (sieving test 2 in Table 3). The grain size of the raw sample 100-200 µm (VN47, Fig. x) has the main part of the minerals within this interval. This indicates that the ilmenite itself is more fine-grained than the average of the raw sample.

XRF of ilmenite

Four XRF analyses of the ilmenite were made: one composite sample of VN 36 - VN 45, VN 36, VN 45 and VN 46 respectively. The results are given in Table 4.

Table 4. XRF results of ilmenite

| Sample_ID | SiO ₂ | TiO ₂ | Al ₂ O ₃ | Fe ₂ O ₃ | MnO | MgO | CaO | Na ₂ O | K ₂ O | P ₂ O ₅ | Volat. | Sum major |
|-----------|------------------|------------------|--------------------------------|--------------------------------|-------|-------|-------|-------------------|------------------|-------------------------------|--------|-----------------|
| VN36-45 | 2,572 | 56,612 | 1,994 | 32,856 | 2,203 | 0,174 | 0,028 | 0,000 | 0,026 | 0,195 | 0,300 | 96,960 |
| VN46 | 0,714 | 58,602 | 0,918 | 33,900 | 2,520 | 0,051 | 0,000 | 0,000 | 0,000 | 0,129 | 0,730 | 97,564 |
| VN36 | 1,913 | 57,592 | 1,346 | 33,713 | 2,259 | 0,109 | 0,018 | 0,000 | 0,010 | 0,167 | -0,140 | 96,987 |
| VN45 | 1,215 | 57,834 | 1,090 | 35,658 | 2,457 | 0,024 | 0,011 | 0,000 | 0,002 | 0,139 | -0,270 | 98,160 |
| | V | Cr | Ni | Zn | Rb | Sr | Y | Zr | Nb | Ba | | Sum, Total min. |
| 754 | 878 | 32 | 415 | 0 | 112 | 646 | 2381 | 923 | 67 | 6504 | 97,610 | |
| 593 | 754 | 0 | 288 | 12 | 114 | 450 | 1083 | 938 | 97 | 4329 | 97,997 | |
| 740 | 772 | 0 | 380 | 10 | 118 | 613 | 2405 | 947 | 119 | 6402 | 97,627 | |
| 699 | 585 | 4 | 378 | 34 | 132 | 418 | 1599 | 885 | 63 | 4928 | 98,653 | |

The TiO₂ content varies with up to 1% between the composite sample (VN 36 – VN 45) and the individual samples from the ilmenite stockpile (VN 36 and VN 45). The TiO₂ content of the ilmenite sample from the separation plant (VN 46) is 2% higher than the composite sample. The variation in TiO₂ grade follows the variation in SiO₂. The Al₂O₃ in ilmenite is c. 1%, the MgO content around 0.1% or less and the MnO contents are approximately 2.5%. Zircon varies from 0.1 – 0.25% and Cr, V, Y and Nb are all below 0.1%.

The difference in the 2% TiO₂ content between the raw sample and the ilmenite concentrate is probably due to the fact that the raw sample go through a separation process where zircon, monazite and rutile are separated out of the HM pre-concentrated sand. In this process we do not know in which fraction the leucoxene will be.

Conclusions

- The fieldwork carried out in Vietnam, May 2003 was focussed on the Ham Tan area, which covers parts of the provinces Binh Thuan and Vung Tau – Ba Ria in southern Vietnam. Altogether 35 samples of raw sand samples were collected. The heavy mineral content in the sands varies a lot within the areas. Most of the heavy mineral occurrences occur in aeolian sand dunes.
- The most promising area for heavy mineral resources is the area between Chum Gang and Tan Thang. These areas have the largest potential in tonnage and are not planned for other purposes such as industrialisation or urbanisation. The highest TiO_2 content in ilmenite around 59% is found in Chum Gang, Bau Doi A and Go Dinh 2.
- A special assignment was to collect samples of the ilmenite concentrate from the Ky Khang deposit, Ha Tinh province. The stockpile was a 15,000 tonne ilmenite heap where 10 samples were taken. XRF results of the ilmenite from the stockpile are given in this document. In addition, a CCSEM analysis is given of the raw sand, which is the basis for the ilmenite concentrate. This CCSEM analysis of the raw sample from Cam Xuyen has high-grade of TiO_2 with more than 60%.
- After discussions with DGMV it seems obvious that DGMV ought to have their own expert in heavy minerals. The heavy mineral business is so important to Vietnam that it would be very beneficial for the country to have experts themselves.
- During the meetings with different organisations in Vietnam it turned out that there is still areas with high-grade ilmenite in Vietnam e.g. the Hué region. The Marine and Mineral Resources Centre gave us this information about the new high-grade ilmenite placer deposits. The Centre will try to help to get this information verified. This Hué region has not been visited in our joint program but will be the next target for investigations.

Acknowledgement

I would like to acknowledge the General Director Mr. Tran Xuan Huong and his staff from the DGMV for a great help in the planning of the fieldwork in this joint project. Especially thanks go to the Deputy Director for 'Division for International Co-operation' Nguyen Xuan Hop and Ms. Bui Thi Huyen, International Co-operation Expert (interpreter) for all the administrative work and getting the permissions from the authorities to make this tour possible. My field companions Deputy Director Mr. Hop from DGMV, the interpreter and Senior Geologist Mr. Thien from the International Co-operation Department, DGMV and the ever talking and hard working driver, Mr. Tinh are thanked for their always-good humour and good company, which make the tour very enjoyable. The help from local institutions and field guides and various people during the fieldwork were indispensable and highly appreciated.

Figure 14. *The sampling has ended – thank you very much to my co-workers.*
